

SOLUTION X

BSE2201 Software Engineering Foundations — Group Assignment Project Pack

Submission: Monday, 28 September 2026

This pack turns the assignment brief into a simple action plan. The source brief says the scope is the landing page only; implementation of the proposed system or an interactive prototype is not required.

1. The problem we are solving

Problem: Important school announcements, deadlines, room changes and other updates can be spread across several communication channels. Students may therefore miss information or spend time searching for it.

People affected: students, lecturers, class representatives and departments.

2. Our proposed solution — CampusConnect

CampusConnect is a proposed central communication platform for school notices. It would organize approved announcements, academic deadlines, reminders and important updates in one place. Our landing page explains the idea; it does not need to implement the system.

Main proposed features

- Central notices
- Deadline reminders
- Search and categories
- Priority updates for important changes
- Student/staff-focused design

3. What the landing page must contain

Team identity; identified problem; proposed system; features and benefits; all 10 team members with responsibilities and GitHub profile links; a working contact link; clear navigation; consistent typography/colours; responsive mobile and desktop layout; no placeholder content at final submission.

4. Suggested Jira work breakdown

Task	Assignee	Acceptance criteria
Create project + repository	Member 01	Jira project, GitHub repo and team access are ready.
Navigation + hero	Member 02	Navigation works and hero introduces Solution X/CampusConnect.
Problem section	Member 03	Problem, affected people and need are clearly explained.
Features section	Member 04	Main features and expected benefits are shown.
Team section	Member 05	All 10 real members, roles and GitHub links are present.
Responsive design	Member 06	Layout works on mobile and desktop.
Accessibility + quality	Member 07	Readable contrast, headings, links and keyboard-friendly navigation checked.
Content + README	Member 08	Content is polished and README has overview, technologies, setup, live link and responsibilities.
Testing + defects	Member 09	Defects are recorded, fixed and verified.
Deployment + integration	Member 10	Public live URL works and final site is checked online.

5. Jira rules to follow

Use the stages **To Do** → **In Progress** → **In Review** → **Done**. Every task needs a description, assignee, due date and acceptance criteria. Each member updates their own tasks and defects are tracked until resolved.

6. GitHub rules to follow

Every student uses their own GitHub account, works on a separate branch for each task, includes the Jira task key in the branch name, makes meaningful commits, opens a pull request, gets a teammate review before merging, and checks that GitHub activity appears in the Jira task. All 10 members must contribute code and review another member's work.

Examples: branch **SCH-12-team-section**; commit **SCH-12 add team section**; pull request title **SCH-12 Add team section**.

7. Deployment

Deploy the completed static landing page to a web hosting platform. The live URL must work without login. Test navigation, images/visuals and contact links online, on both mobile and desktop. Use the deployed page in the presentation.

8. Contribution table — complete before submission

Name	Student No.	GitHub username	Jira key(s)	Pull request link
Member 01	_____	_____	_____	_____
Member 02	_____	_____	_____	_____
Member 03	_____	_____	_____	_____
Member 04	_____	_____	_____	_____
Member 05	_____	_____	_____	_____
Member 06	_____	_____	_____	_____
Member 07	_____	_____	_____	_____
Member 08	_____	_____	_____	_____
Member 09	_____	_____	_____	_____
Member 10	_____	_____	_____	_____

9. Presentation checklist

Before presentation, confirm: (1) live landing page opens without login; (2) GitHub repository is accessible to lecturer; (3) Jira project is accessible to lecturer; (4) contribution table is complete; (5) all 10 members attend; (6) each member can explain their contribution; (7) each member can open their Jira task and show the linked branch, commits and pull request; (8) the team can explain the problem and CampusConnect proposal.

10. Final submission checklist

- Public live landing-page URL
- GitHub repository URL
- Jira project URL
- Completed contribution table
- README.md
- No placeholder team names or fake profile links
- Mobile and desktop testing completed
- All links tested
- All 10 members have code contributions and review activity

Important note

The CampusConnect problem and system are a proposed project direction created for this assignment. Your group should confirm that the problem is relevant to your school and adjust the wording after discussing it with your lecturer or classmates. Do not claim that you collected survey statistics unless you actually did.
